Our ultra-flat and stylish magnetic plates made of 1.4016 magnetic stainless steel are available in black, white and a classic stainless steel finish. Thanks to their additional powder coating, they not only offer an attractive appearance, but also practical advantages - drilling is completely unnecessary!

With a thickness of just 2 mm, these adhesive bases are the perfect complement to our rubberised magnets and offer a wide range of applications in the workshop, office and more. Our highly adhesive nano adhesive pads ensure effortless application and later residue-free removal of the adhesive plates. Installation is child's play: make sure the surface is free of grease and soap before application to ensure optimum adhesion. Avoid sharp objects or abrasive cleaners to prevent damage to the stainless steel surface.

An important note: To remove the magnetic plate, simply heat it with a hairdryer (please take into account the heat resistance of the surface) and carefully peel it off from one corner. If necessary, a plastic tool can be used to avoid deformation. The adhesive plates should not be constantly replaced.
